GitHub repo

- <https://github.com/Indigma-Innovations/veleshack-2026-4th-challenge>
- Final policy: Cycle-Aware Planner.
- Inputs: current wallet and capacities, prior prices, own profile and public rival batteries.
- Execution: observer cache and guarded Kelly fallback. A separate heartbeat thread renews the lease.
- HTTP client: bounded retry/backoff for 503/429. The loop sanitizes bids and collects results after bidding.
- Deployment: standalone Python 3.12 + httpx. Docker Compose runs the agent, arena and three bots.
- An online comparison Arena of all policies we developed in the hackathon is available here:

Summary

Aspect	Lookahead Planner	Cycle-Aware Planner
What it is	Six-round planner over three future paths	Same planner plus cutoff bids and causal refinement
Inputs	Wallet, capacities, prior prices, public profiles and own results	Same public inputs
Energy search	Coarse grid and battery taper	Adds own and rival battery-cutoff crossings
Future decision	Fixed taper during rollouts	Two-round next-step choice for three shortlisted bids
Fitting	None	None

The added search improves the timing of battery rests and floor misses.

Highlights

Cycle-Aware wins 620/1,000 seeds. Mean paired gain +1.390%.

CardanoEdge - 1,000 paired graded simulations
